Past Performance

Software development project for major retail chain's website

In 2007, a major retail chain embarked on a new development project to apply specific pricing promotions to customer's online orders. The application would need to provide high-volume unit-level pricing for internet products, apply the high-volume pricing to millions of customer orders everyday and provide a user interface for the retail chain to manage item pricing, pricing rules and promotions necessary to ensure promotions and high volume prices were applied properly to customer orders. Since the pricing application would support the company's entire direct-to-customer business, it was essential to develop a solution that would not only optimize the client's investment in new technologies but also integrate seamlessly with existing systems and processes. Using Agile development methodology, construction of the applications had already begun, but the retail giant needed to bring in developers midstream to finish the job.

Results

The InSource Group partnered with the client's project managers to build a team of senior Java developers for the high-volume pricing engine and the user interface. The InSource Group provided 7 of the 10 senior developers for the project. Each developer brought both technical and leadership skills required to successfully complete the job. The InSource Group developers worked closely with business subject matter experts to hone the actual business requirements necessary to achieve a world-class application that addressed the client's business needs.

SQL server datamart and data warehouse created for defense industry client

A large defense contractor required an SQL Server Datamart and Data Warehouse utilized for scoreboarding, dashboarding, planning and reporting. To deliver this functionality throughout the organization, developers were required to provide architecture, design, performance and disaster recovery utilizing Microsoft Sharepoint Architecture. This application would serve 2,000 users across 42 site collections and was estimated to grow from 70 gigabytes to 500 gigabytes in 18 to 24 months.

Results

The InSource Group provided critical personnel to augment the defense contractor's team for a year. Their efforts resulted in significant changes to the operational management of the company for executive level, for the first time, daily and weekly reporting of engineering data, which provided new views into the activity and real time access to data for multiple functional areas was possible. In addition, the application allowed for successful integration of multiple business acquisitions.
